A Comparison of $\delta^{13}C$ & pMC Values for Ten Cretaceous-jurassic Dinosaur Bones from Texas to Alaska Usa, China and Europe

Hugh MILLER^{1*+}, Hugh OWEN¹, Robert BENNETT¹, Jean DE PONTCHARRA², Maciej GIERTYCH³, Joe TAYLOR¹, Marie Claire VAN OOSTERWYCH², Otis KLINE¹, Doug WILDER¹, Beatrice DUNKEL¹

¹Paleo Group, United States, ²Paleo Group, France, ³Paleo Group, Poland

*Corresponding author: hugoc14@aol.com +Presenter

Presented here are results of studies comparing $\delta^{13}C$ and percent of modern ^{14}C (pMC) for various bone fractions such as residual collagen, in-situ $CaCO_3$ (in bioapatite), etc. from eight dinosaurs from TX to AK and one from China. The Accelerated Mass Spectrometer (AMS) was used for 20 of 22 samples primarily at University of Georgia (USA) with Sensitivity $\geq 50,000$ RC years. All samples were pretreated to remove contaminants. The two large samples were tested on conventional equipment as another cross check.

The $\delta^{13}C$ range was -20.1 to -23.8 for collagen and -3.1 to -9.1 for $CaCO_3$ with the pMC range of 6.45 to 0.76 which translates to apparent ages of $22,020 \pm 50$ for $CaCO_3$ in a *Psittacosaurus* from the Gobi Desert to $39,230 \pm 140$ RC years for $CaCO_3$ in a *Triceratops* from Montana. Included in this study were an *Allosaurus*, *Acrocanthosaurus*, *Apatosaurus*, two *Triceratops* and three *Hadrosaurs*. Documentation will include dinosaur verifications, geological formations, $\delta^{13}C$, pMC's, ^{14}C methodologies and laboratories.

When 2g of a Belgium Mosasaur were pretreated to remove contaminants the pMC was 4.68 or 24,600 RC years (Lindgren et al. 2011, PloS ONE, page 9). This *Mosasaur* age was also concordant with pMC's for dinosaurs from TX to AK and China (no $\delta^{13}C$).

$\delta^{13}C$ values in this study were similar to dinosaur $\delta^{13}C$ values from the Judith River formation in Alberta, Canada that also reported $\delta^{15}N$ but not pMC's (Ostrom et al. 1993, Geology, v. 21). Radiocarbon methods are valuable in geochronology (accuracy to $\geq 40,000$ RC years in varved Lake Suigetsu, Japan). Sediments deposit as function of particle size and density, not time in moving waters so this helps explain pMC's in dinosaur bones (Berthault 2002, *Geodesy and Geodynamics* 22, China). Primary areas for further fossil studies would be Alberta, Canada, Gobi Desert and Zhucheng, China.
